

Customer Meeting Report On Friday 4/6/2012

Issues that were raised by our customers

In our meeting, one issue the customer raised was whether the user or the friends will create the list. Other questions the customer raised were: how do we communicate with other users, and why do we need Amazon cloud service. He also asked what version of Android OS we are going to support in our software.

High-level plans for addressing these issues

In our response to who will create the list, we told the customer that there are two lists. One of the lists will store information of friends' recommendations. The other list will store user defined events or items. We explained that we will use Amazon cloud for the storage of friends' recommended data and the Amazon server for users to interact with each other. We will store the user defined list in the Android device database and user recommended information in Amazon cloud. If Amazon cloud is having trouble, our alternative will be to use instant messages and contact lists in the Android phone to allow user interactions. We told our customer that we are going to implement ForgetMeNot (code named Android Lunch) in Android 2.0.1. At the end of the meeting, we discussed the deadline of each milestone and scheduled the next meeting with the customer.
